

Manthan Agent — Bug Report

SahuAI-PRO-Lite / Beta / index.html

Static analysis of structure, assets, providers, UI wiring, and dependencies

Generated: 23 September 2026, 13:28 IST

Source: <https://github.com/Saksham6062/SahuAI-PRO-Lite/blob/main/Beta/index.html>

Severity	Count	Examples
Critical / High	5	Missing PWA assets, wrong Z.ai endpoint, empty models, version mismatch, no DOCTYPE
Medium	6	Broken CDN, unused libs, dead IDs, invalid font weights, Tailwind double-load
Low / Quality	4	A11y gaps, zoom lock, leftover feature IDs, XSS hygiene notes

Note: Inline JS syntax is valid. HTML tag balance looks OK. Core send/voice/stop flow via #dynamicActionBtn works. Many older issues are already marked fixed in comments.

1. Critical / High Impact

1.1 Missing PWA / local assets (404)

Referenced in the HTML but **not present** in the Beta/ folder on GitHub (only index.html exists):

Reference	Status
./manifest.json	404
./icon-512.png	404
./icon-192.png	404
./sahu-moe.apk	404

Impact: PWA install, favicon, Apple touch icon, and “Install Android App” all fail.

1.2 Wrong Z.ai / “Fireworks” endpoint (pass vs paas)

Official Z.ai endpoint is `https://api.z.ai/api/paas/v4/chat/completions`.

- **zai** provider → correct: `.../paas/v4/...`
- **fireworks** (misabeled “Zhipu AI”) → **wrong**: `.../pass/v4/...`

Impact: All requests through the fireworks provider fail with a bad URL.

1.3 Provider configuration bugs

- **bynara:** models is empty ({} — provider is unusable.
- **fireworks:** display name “Zhipu AI”, Z.ai URL, key name sahu_fireworks_key — identity is inconsistent.
- Model label typo: 'GLM 5 Turbo' should be 'GLM 5 Turbo' (model id glm-5-turbo is correct).

1.4 Version string inconsistency

Location	Version shown
<title> / meta description	v7.8
Sidebar UI	Version 5.0
CSS / JS comments	up to v7.9.x
Main script banner	v5.0

Impact: Confusing for users and for support/debugging.

1.5 Missing <!DOCTYPE html>

File starts with <html lang="en">. Without a doctype, browsers may enter quirks mode, causing inconsistent layout and behavior.

2. Medium Impact

2.1 Broken / unused CDN: html2canvas-pro

Loaded as <script src="https://cdn.jsdelivr.net/npm/html2canvas-pro">. The package is ESM ("type": "module") but is loaded as a classic script, so it likely fails or does nothing. It is also **never referenced** in application JS (dead dependency).

2.2 Unused dependency: string-similarity

Loaded from CDN but never used in any of the six inline script blocks.

2.3 Dead UI element references

JS still targets IDs that do not exist in the HTML (mostly guarded with if (el), so no crash, but dead code):

- sendBtn — actual send UI is #dynamicActionBtn
- deepThinkBtn — DeepThink control is #toolDeepThinkNew + budget row

Leftover from older UI; misleading for maintenance.

2.4 Invalid Google Fonts weights

Request uses Inter weights 400;450;500;550;600;650;700;800. Weights **450, 550, 650** are non-standard; Google Fonts may ignore them or serve unexpected faces.

2.5 Tailwind loaded twice

1) Runtime CDN: cdn.tailwindcss.com — 2) Large precompiled Tailwind CSS block before </head>. Extra download, possible class conflicts, slower first paint.

2.6 Function stubs before real implementations

First inline script defines empty stubs (e.g. `function sendMessage() {}`). Main script later redefines them. Order is correct today, but any future reordering or parallel loading would break the app.

3. Lower Impact / Quality & Accessibility

3.1 Almost no accessibility attributes

Roughly one aria- / role usage in the entire file. Screen readers, keyboard navigation, and focus management are weak for a complex chat UI.

3.2 user-scalable=no + maximum-scale=1.0

Viewport meta blocks pinch-zoom — WCAG accessibility issue on mobile.

3.3 Leftover “advanced feature” IDs

JS still references toggles/settings that were removed (e.g. `neuralConsensusCheck`, `agentSwarmCheck`, `debateModeCheck`). Dead paths, not runtime crashes.

3.4 Security / hygiene notes

- Heavy use of innerHTML with mixed escaping — XSS risk if untrusted content slips through.
- Cross-origin `postMessage(..., "**")` in the live-preview bridge.
- No Content-Security-Policy meta tag.

4. What Is Not Broken (Verified)

- Inline JS syntax is valid (node --check on all 6 inline scripts).
- HTML tag balance looks OK (parser reported no mismatch).
- Core flow uses `#dynamicActionBtn + handleDynamicAction()` correctly for send / voice / stop.
- Many historical issues are already commented as fixed (incognito history, sidebar on mobile, stop/abort, etc.).

5. Suggested Fix Priority

#	Action
1	Add manifest.json, icons, and APK — or remove those links.
2	Fix fireworks endpoint: <code>pass</code> → <code>paas</code> ; align name/key with Zhipu or Fireworks.
3	Fix 'GLM 5 Turbo' → 'GLM 5 Turbo'; populate or remove bynara.
4	Align all version strings (title, sidebar, comments) to one number (e.g. 7.9.x).
5	Add <code><!DOCTYPE html></code> .
6	Remove or correctly load <code>html2canvas-pro</code> ; drop unused <code>string-similarity</code> .
7	Remove dead IDs (<code>sendBtn</code> , <code>deepThinkBtn</code>) or restore matching elements.
8	Clean font weights; consider dropping runtime Tailwind if precompiled CSS is complete.
