

Manthan Agent

Skills Assessment Report

Which skills from the Unified AI Skills Report can be added to Manthan Agent v7.9.12
Based on comparison with Sarvam · ChatGPT · Grok · GLM · Mimo/OpenClaw · MiniMax · Claude
and others

25 September 2026

Already present	Can be added	Do not add
11 built-in skills covering search, code, files, preview, swarm, skill creator	7 high-value + 3 medium-effort instruction / workflow skills that fit the browser architecture	OS tools, platform bots, native media, server-only engines — incompatible with client-side Manthan

1. Skills Already Present in Manthan

Manthan Agent v7.9.12 already ships with a complete agentic skill set. These cover the high-value capabilities found across Sarvam, Grok, GLM, Claude and MiniMax document/search/code stacks. Do not re-implement them.

#	Skill	Type	Covers from the report
1	Web Search	Agentic	ChatGPT / Grok / GLM / OpenClaw web research
2	Web Scraping	Agentic	Full-page reading (READ directive)
3	Web Fetching	Agentic	Raw URL / API / JSON / markdown fetch
4	Code Interpreter	Agentic	Python (Pyodide) + JS; data analysis & charts
5	File Creation	Agentic	pdf · pptx · xlsx · docx · md · csv · json
6	Live Preview	Agentic	HTML / React sandboxed live preview
7	Skill Creator	Meta	Grok / Claude / Mimo skill-creator pattern
8	MCP: Date & Time	MCP	Real local / UTC time (no guessed dates)
9	MCP: Calculator	MCP	Exact math engine (no eval)
10	Agent Swarm	MCP	2–10 parallel workers; multi-part research
11	Web Browsing	Agentic	Page skim + link discovery (BROWSE)

These 11 skills already map to the strongest overlapping capabilities in the Unified Report (document production, search, code, preview, swarm, skill creation).

2. Skills That Can Be Added

These fit Manthan's browser-only architecture (Pyodide, client-side file generation, sandboxed iframe). They are pure instruction packs or thin directive layers on top of existing runtimes — ideal as Custom Skills via Skill Creator, or as new SAHU_SKILLS entries.

2.1 High-value, low-effort

Skill	Source inspiration	What to implement
Clarify / Requirements gatherer	Mimo · OpenClaw clarify	Force targeted clarifying questions before long docs or decks.
Humanizer / Polish / Quieter / Bolder	Mimo style skills	Post-process answers to remove AI-sounding phrases, tighten or amplify voice.
Typeset / Layout QA checklist	Grok · GLM layout rules	Rules for headings, tables, orphans, fonts when emitting FILE[docx/pdf/pptx].
Research synthesis / Source ranking	Agent Swarm + web	Explicit contradiction resolution and source reliability notes.
Diagram / Mermaid guidance	GLM charts & diagrams	When to emit Mermaid or structured diagram descriptions.
Persona / Style packs	Manthan UI + GLM	Deeper instruction packs (e.g. MP Board Examiner, Investor deck narrative).
Self-improvement / Learning log	Mimo self-improvement	Append short notes when the user corrects the model.

2.2 Medium effort (still feasible)

Skill	What it adds
Doc co-authoring workflow	Sarvam-style: clarify → outline/todo → draft → review as multi-turn instruction skill.
Chart selection guide	GLM-style “when to use bar vs line vs donut” — steers Code Interpreter / File Creation.
Form-filling / PDF table prompts	Instruction layer on top of existing file + scrape (no full pypdf server stack needed).

*Preferred path: create them with the existing **Skill Creator** (MAKESKILL blocks). They appear under Custom skills with on/off toggles and persist across reloads.*

3. Skills That Should Not Be Added

These require a host OS, native CLIs, authenticated SaaS beyond user-configured API keys, or server-side packages. Manthan runs entirely in the browser and cannot support them without a major architecture change.

Category	Examples from the report	Why incompatible
OS / desktop tools	Apple Reminders, Things, Obsidian, tmux, Sonos, Hue, 1Password, camsnap, peekaboo	Need native apps / shell
Platform channels	DingTalk, Feishu, QQ, Discord bots, WhatsApp send, X API, full GitHub CLI	Need OAuth + server bots
Native media pipeline	ffmpeg-heavy video, system TTS/STT, local Whisper	No system binaries
Server document engines	Full reportlab/pypdf/LibreOffice QA loops, tax-form fillers	Already partially covered client-side; heavy stack needs host
Hardware / device control	Camera, smart-home, phone node tools	No device access from browser sandbox
Most OpenClaw “installed but inactive”	Environment-specific plugins assuming persistent agent host	Assume shell, cron, external CLIs

4. Recommended Way to Add Skills

- **Preferred:** Use the existing Skill Creator (MAKESKILL : blocks). Skills appear under Custom skills with their own toggle and persist.
- **First-class built-ins:** Extend the SAHU_SKILLS array and the matching prompt-injection / directive handlers (same pattern as web_search, mcp_calc, agent_swarm).
- **Constraint:** Keep new skills instruction-only or directive + existing runtime (search, code, file, preview, swarm). Do not port environment-specific OpenClaw / Mimo plugins.

5. Summary Verdict

Manthan's current 11 skills already cover the high-value document, code, search, and swarm capabilities from Sarvam, Grok, GLM, Claude and MiniMax. Add the pure-instruction / workflow skills listed in Section 2 (clarify, humanizer/polish, typeset QA, research synthesis, diagram guidance, deeper personas, self-improvement). Skip anything that requires a host OS, native CLIs, or external platform bots.
